### UNIFIED APPROACH TO SPIN HYDRODYNAMICS

#### Wojciech Florkowski

Institute of Theoretical Physics, Jagiellonian University, Kraków, Poland

EMMI Workshop at the University of Wrocław Aspects of Criticality II 2-4 July 2024, Wrocław, Poland

based on: WF + M. Hontarenko, arXiv:2405.03263

### Outline

#### 1. Introduction

- 1.1 Is QGP the most vortical fluid?
- 1.2 Equilibrated spin
- 1.3 Different formulations of spin hydrodynamics

#### 2. Kinetic-theory $\rightarrow$ perfect spin hydrodynamics

- 2.1 Thermodynamic identities
- 2.2 Kinetic theory for particles with spin

#### 3. Positive entropy production $\rightarrow$ dissipative spin hydrodynamics

- 3.1 Non-equilibrium entropy current
- 3.2 Tensor decompositions
- 3.3 Navier-Stokes limit

#### 4. Summary & Outlook

### First positive measurements of $\Lambda$ spin polarization

Non-central heavy-ion collisions create fireballs with large global angular momenta which may generate a spin polarization of the hot and dense matter in a way similar to the Einstein-de Haas and Barnett effects Much effort has recently been invested in studies of polarization and spin dynamics of particles produced in high-energy nuclear collisions, both from the experimental and theoretical point of view L. Adamczyk et al. (STAR), (2017), Nature 548 (2017) 62-65, arXiv:1701.06657 (nucl-ex)

Global A hyperon polarization in nuclear collisions: evidence for the most vortical fluid www.sciencenews.org/article/smashing-gold-ions-creates-most-swirly-fluid-ever

The  $\sqrt{s_{NN}}$ -averaged polarizations indicate a vorticity of  $\omega = (9 \pm 1) \times 10^{21} \text{ s}^{-1}$ , with a systematic uncertainty of a factor of two, mostly owing to uncertainties in the temperatur This far surpasses the vorticity of all other known fluids, including solar subsurface flow<sup>23</sup> ( $10^{-5} \text{ s}^{-1}$ ); supercell tornado cores<sup>25</sup> ( $10^{-5} \text{ s}^{-1}$ ); supercell tornado cores<sup>25</sup> ( $10^{-5} \text{ s}^{-1}$ ); supercell tornado the solar bubbles ( $100 \text{ s}^{-1}$ ); the great red spot of Jupiter<sup>26</sup> (up to  $10^{-4} \text{ s}^{-1}$ ); and the rotating, heated soap bubbles ( $100 \text{ s}^{-1}$ ) used to model climate change<sup>22</sup>. Vorticities of up to  $150 \text{ s}^{-1}$  have been measured in turbulent flow<sup>28</sup> in bulk superfluid He II, and Gomez *et al.*<sup>29</sup> have recent produced superfluid nanodroplets with  $\omega = 10^{7} \text{ s}^{-1}$ .

 $\Delta t = 1 \text{ fm/c} = 3 \times 10^{-24} \text{ s}, \qquad \Delta t \,\omega_{\text{max}} = 27 \times 10^{-24} \times 10^{21} = 2.7 \times 10^{-2}$ Large angular momentum does not mean large rotation!

### 1.2 Equilibrated spin

J. Weyssenhoff and A. Raabe, Acta Phys. Pol. 9 (1947) 7 revival of interest in hydrodynamics of spin polarized systems in a series of works by Francesco Becattini and collaborators

Connection betweeen theory and experiment by the "spin Cooper-Frye formula" Pauli-Lubański vector defined by the spin polarization tensor  $\omega^{\mu\nu}$ 

$$\pi^{\mu}(p) = -\frac{1}{8m} \varepsilon^{\mu\rho\sigma\tau} p_{\tau} \frac{\int d\Sigma_{\lambda} p^{\lambda} n(1-n) \omega_{\rho\sigma}}{\int d\Sigma_{\lambda} p^{\lambda} n}$$

integral over freeze-out hypersurface  $\Sigma$  (1)

 spin degrees of freedom are equilibrated, spin-orbit coupling interaction included, asymmetric energy-momentum tensor, the spin polarization tensor is equal to thermal vorticity

$$\omega_{\mu\nu} = \omega_{\mu\nu} = -1/2 \left( \partial_{\mu} \beta_{\nu} - \partial_{\nu} \beta_{\mu} \right) \qquad \beta^{\mu} = u^{\mu}/T, \quad \beta = 1/T$$

the spin polarization tensor is not an independent hydrodynamic variable

- standard (dissipative) hydro is used,  $\omega_{\mu\nu}$  determined by the standard hydrodynamic variables such as *T* and  $u^{\mu}$
- recent works on extension to include effects of the shear stress tensor
- equilibrium distribution functions obtained from QFT (Dirac field under rotation and acceleration, very specific boundary conditions)
- great success in decribing global polarization, problems to explain the longitudinal polarization

### 1.3 Different formulations of spin hydrodynamics

#### the case of massive spin-1/2 particles is considered only in this talk

- THV (thermal vorticity oriented) approach described above
   F. Becattini, L. Tinti, V. Chandra, I. Del Zanna, E. Grossi, M. Buzzegoli, G. Inghirami, I. Karpenko, ...
- 2. KT (kinetic theory) approach (Wigner functions, classical treatment of spin)
  - 2.1 LKT local collisions, spin part of total angular momentum conserved

B. Friman, WF, A. Jaiswal, E. Speranza, R. Ryblewski, A. Kumar, S. Bhadury, R. Singh, ...

2.2 NLKT - non-local collisions included, only total angular momentum conserved

N. Weickgenannt, E. Speranza, D. Rischke, D. Wagner, X.-L. Sheng, ...

#### 3. IS (Israel-Stewart) approach

K. Hattori, M. Hongo, X.-G. Huang, M. Matsuo, K. Fukushima, S. Pu, A. Daher, A. Das, R. Biswas, G. Sarwar, M. Hasanujjaman, J. R. Bhatt, H. Mishra, J.-e. Alam, D.-L. Wang, S. Fang, ...

#### 4. Lagrangian formulation

G. Torrieri, D. Montenegro, K. J. Goncalves, ...

#### STATISTICAL PHYSICS VS. THERMODYNAMICS KINETIC THEORY VS. HYDRODYNAMICS

### 2 Kinetic-theory → perfect spin hydrodynamics

### 2.1 Thermodynamic identities

• • • • • • • • • • • •

## Standard form of thermodynamic relations extensivity $\rightarrow$ intensivity rule

$$E + PV = TS + \mu N \rightarrow \epsilon + P = T\sigma + \mu n$$
 (2)

first law of thermodynamics and Gibbs-Duhem relation

$$d\varepsilon = Td\sigma + \mu dn, \qquad dP = \sigma dT + nd\mu$$
 (3)

 $\varepsilon$ , *P*, *T*,  $\sigma$ ,  $\mu$  and *n* are the local energy density, pressure, temperature, entropy density, baryon chemical potential, and baryon number density

#### Tensor form of thermodynamic relations (Israel-Stewart) entropy current

$$S_{\rm eq}^{\mu} = \sigma u^{\mu} = P \beta^{\mu} - \xi N_{\rm eq}^{\mu} + \beta_{\lambda} T_{\rm eq}^{\lambda \mu}$$
(4)

$$dS_{\rm eq}^{\mu} = -\xi dN_{\rm eq}^{\mu} + \beta_{\lambda} dT_{\rm eq}^{\lambda\mu}, \qquad d(P\beta^{\mu}) = N_{\rm eq}^{\mu} d\xi - T_{\rm eq}^{\lambda\mu} d\beta_{\lambda}$$
(5)

standard notation:  $\beta^{\mu} = u^{\mu}/T$ ,  $\beta = \sqrt{\beta^{\lambda}\beta_{\lambda}} = 1/T$ , and  $\xi = \mu/T$ 

perfect-fluid forms:  $N_{eq}^{\mu} = nu^{\mu}$  and  $T_{eq}^{\lambda\mu} = (\varepsilon + P)u^{\lambda}u^{\mu} - Pg^{\lambda\mu} = \varepsilon u^{\lambda}u^{\mu} - P\Delta^{\lambda\mu}$ 

**inclusion of spin**,  $\Omega_{\alpha\beta}$  - spin chemical potential,  $S^{\alpha\beta}$  - spin density tensor

$$\varepsilon + \mathbf{P} = \mathbf{T}\sigma + \mu \mathbf{n} + \frac{1}{2}\Omega_{\alpha\beta}\mathbf{S}^{\alpha\beta} \tag{6}$$

$$d\varepsilon = Td\sigma + \mu dn + \frac{1}{2}\Omega_{\alpha\beta}d\mathbf{S}^{\alpha\beta}, \qquad dP = \sigma dT + nd\mu + \frac{1}{2}\mathbf{S}^{\alpha\beta}d\Omega_{\alpha\beta}$$
(7)

multiplication of the above equations by the hydrodynamic flow vector *u* gives the tensor (Israel-Stewart) form

$$\mathbf{S}_{\mathrm{eq}}^{\mu} = \mathbf{P}\beta^{\mu} - \xi \mathbf{N}_{\mathrm{eq}}^{\mu} + \beta_{\lambda} T_{\mathrm{eq}}^{\lambda\mu} - \frac{1}{2} \omega_{\alpha\beta} \mathbf{S}_{\mathrm{eq}}^{\mu,\alpha\beta}$$
(8)

$$dS_{eq}^{\mu} = -\xi dN_{eq}^{\mu} + \beta_{\lambda} dT_{eq}^{\lambda\mu} - \frac{1}{2}\omega_{\alpha\beta} dS_{eq}^{\mu,\alpha\beta}, \quad d(P\beta^{\mu}) = N_{eq}^{\mu} d\xi - T_{eq}^{\lambda\mu} d\beta_{\lambda} + \frac{1}{2}S_{eq}^{\mu,\alpha\beta} d\omega_{\alpha\beta} \quad (9)$$
spin tensor

$$S_{\rm eq}^{\mu,\alpha\beta} = u^{\mu} S_{\rm eq}^{\alpha\beta} \tag{10}$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

analog to the perfect-fluid forms of  $N_{\rm eq}^{\mu}$  and  $T_{\rm eq}^{\lambda\mu}$ 

### 2.2 Kinetic theory for particles with spin

Internal angular momentum (Mathisson), classical spin vector, extended phase-space Review: WF, A. Kumar, R. Ryblewski, Prog.Part.Nucl.Phys. 108 (2019) 103709

$$s^{\alpha\beta} = \frac{1}{m} \varepsilon^{\alpha\beta\gamma\delta} p_{\gamma} s_{\delta}, \quad p_{\alpha} s^{\alpha} = 0, \quad s^{\alpha} = \frac{1}{2m} \varepsilon^{\alpha\beta\gamma\delta} p_{\beta} s_{\gamma\delta}$$
(11)

$$f_{\rm eq}^{\pm}(x,p,s) = \exp\left(-p \cdot \beta(x) \pm \xi(x) + \frac{1}{2}\omega_{\alpha\beta}(x)s^{\alpha\beta}\right)$$
(12)

macroscopic quantities expressed as the moments of the distribution function

$$N_{\rm eq}^{\mu} = \int dP \, dS \, p^{\mu} \left[ f_{\rm eq}^{+}(x, p, s) - f_{\rm eq}^{-}(x, p, s) \right], \qquad \partial_{\mu} N_{\rm eq}^{\mu} = 0 \tag{13}$$

$$T_{\rm eq}^{\mu\nu} = \int dP \, dS \, p^{\mu} p^{\nu} \left[ f_{\rm eq}^{+}(x, p, s) + f_{\rm eq}^{-}(x, p, s) \right], \qquad \partial_{\mu} T_{\rm eq}^{\mu\nu} = 0 \tag{14}$$

$$S_{\rm eq}^{\lambda,\mu\nu} = \int dP \, dS \, p^{\lambda} \, s^{\mu\nu} \Big[ f_{\rm eq}^+(x,p,s) + f_{\rm eq}^-(x,p,s) \Big], \qquad \partial_{\lambda} S_{\rm eq}^{\lambda,\mu\nu} = 0 \tag{15}$$

conservation laws determine:  $\beta(x)$ ,  $\xi(x)$ , and  $\omega_{\alpha\beta}(x)$  — perfect spin hydrodynamics

イロト 不得 トイヨト イヨト

parametrization of the spin polarization tensor in terms of electric- and magnetic-like components (*k* and  $\omega$ ) in a direct analogy to MHD

$$\omega_{\alpha\beta} = k_{\alpha} u_{\beta} - k_{\beta} u_{\alpha} + t_{\alpha\beta}, \qquad t_{\alpha\beta} = \epsilon_{\alpha\beta\gamma\delta} u^{\gamma} \omega^{\delta}$$
(16)

*k* and  $\omega$  are orthogonal to the flow vector:  $k \cdot u = 0$  and  $\omega \cdot u = 0$ 

spin tensor in the lowest order of k and  $\omega$  (linear contribution)

$$S_{eq}^{\lambda,\mu\nu} = u^{\lambda} [A(T,\mu) (k^{\mu}u^{\nu} - k^{\nu}u^{\mu}) + A_{1}(T,\mu)t^{\mu\nu}]$$

$$+ \frac{A_{3}(T,\mu)}{2} (t^{\lambda\mu}u^{\nu} - t^{\lambda\nu}u^{\mu} + \Delta^{\lambda\mu}k^{\nu} - \Delta^{\lambda\nu}k^{\mu})$$

$$= u^{\lambda} S_{eq}^{\mu\nu} + \text{problem}$$
(17)

problem = term that is not proportional to  $u^{\lambda}$  kinetic theory does not lead to the form  $S_{eq}^{\mu,\alpha\beta} = u^{\mu}S_{eq}^{\alpha\beta}$ , even in local equilibrium state

#### different ways to proceed:

• IS approach, the kinetic theory result is ignored, one uses the form  $S_{eq}^{\mu,\alpha\beta} = u^{\mu}S_{eq}^{\alpha\beta}$ , even with a further simplifying assumption that  $S_{eq}^{\alpha\beta} = A(T,\mu)\omega^{\alpha\beta}$  [phenomenological formula for the spin tensor] the phenomenological form is not connected to other versions by a pseudogauge transformation; dissipative spin hydrodynamics including the phenomenological spin tensor as the leading contribution is unstable, even in the second-order theory; inconsistent treatment of thermodynamic relations, terms like  $\omega_{\mu\nu}S_{eq}^{\mu\nu}$  treated as first-order corrections although they are of the second order

#### LKT approach, only the linear terms are kept

the resulting formalism describes spin evolving in an external standard hydrodynamic background, since corrections to the energy-momentum tensor and baryon current start with the quadratic terms; moderately unstable solutions found for this scheme, thermodynamic relations become trivial, reduce to the standard ones

< 日 > < 同 > < 回 > < 回 > < □ > <

#### a solution stands behind the corner ......

W. Florkowski (IFT UJ)

From (11)–(14) one obtains tensor forms of thermodynamic relations valid for any value of the spin polarization tensor  $\omega$ 

$$S_{\rm eq}^{\mu} = T_{\rm eq}^{\mu\alpha}\beta_{\alpha} - \frac{1}{2}\omega_{\alpha\beta}S_{\rm eq}^{\mu,\alpha\beta} - \xi N_{\rm eq}^{\mu} + N^{\mu}, \qquad N^{\mu} = \coth\xi \ N_{\rm eq}^{\mu} \neq Pu^{\mu}$$
(18)

$$dS_{\rm eq}^{\mu} = -\xi dN_{\rm eq}^{\mu} + \beta_{\lambda} dT_{\rm eq}^{\lambda\mu} - \frac{1}{2}\omega_{\alpha\beta} dS_{\rm eq}^{\mu,\alpha\beta} \qquad \text{first law of thermodynamics}$$
(19)

$$d\mathcal{N}^{\mu} = N_{\rm eq}^{\mu} d\xi - T_{\rm eq}^{\lambda\mu} d\beta_{\lambda} + \frac{1}{2} S_{\rm eq}^{\mu,\alpha\beta} d\omega_{\alpha\beta} \qquad \text{Gibbs-Duhem relations}$$
(20)

Expansion up to second order in  $\omega$ 

$$N_{\rm eq}^{\mu} = \bar{n}(T,\xi,k^2,\omega^2)u^{\mu} + n_t(T,\xi)t^{\mu}, \qquad (21)$$

$$T_{\rm eq}^{\mu\nu} = \bar{\varepsilon}(T,\xi,k^2,\omega^2)u^{\mu}u^{\nu} - \bar{P}_{k\omega}(T,\xi,k^2,\omega^2)\Delta^{\mu\nu}$$

$$+ P_{k\omega}(T,\xi)(k^{\langle\mu}k^{\nu\rangle} + \omega^{\langle\mu}\omega^{\nu\rangle}) + P_t(T,\xi)(t^{\mu}u^{\nu} + t^{\nu}u^{\mu}).$$
(22)

 $t^{\mu} = t^{\mu\nu} k_{\nu} = \epsilon^{\mu\nu\alpha\beta} k_{\nu} u_{\alpha} \omega_{\beta}$ 

$$T_{\rm eq}^{\mu\nu} = \bar{\varepsilon}(T,\xi,k^2,\omega^2)u^{\mu}u^{\nu} - \bar{P}_{k\omega}(T,\xi,k^2,\omega^2)\Delta^{\mu\nu}$$

$$+ P_{k\omega}(T,\xi)(k^{\langle\mu}k^{\nu\rangle} + \omega^{\langle\mu}\omega^{\nu\rangle}) + P_t(T,\xi)(t^{\mu}u^{\nu} + t^{\nu}u^{\mu}).$$
(23)

Strong similarity to the case of anisotropic relativistic magnetohydrodynamics  $E^{\mu} = 0, B^{\mu} \neq 0$  (similarly to  $k^{\mu} = 0, t^{\mu} = 0, \omega^{\mu} \neq 0$ )

$$T^{\mu\nu}_{;\nu} = \left[ \left( \epsilon + p_{\perp} + \frac{B^2}{4\pi} \right) U^{\mu} U^{\nu} - \left( p_{\perp} + \frac{B^2}{8\pi} \right) g^{\mu\nu} + \left( p_{\parallel} - p_{\perp} - \frac{B^2}{4\pi} \right) n^{\mu} n^{\nu} \right]_{;\nu} = 0, \quad (39)$$

Unified spin hydrodynamics

→

# 3 Positive entropy production $\rightarrow$ dissipative spin hydrodynamics

### 3.1 Non-equilibrium entropy current

・ロト ・ 同ト ・ ヨト ・ ヨ

IS method - replacement of the equilibrium currents by the general ones (equilibrium + non-equilibrium corrections)

$$S^{\mu} = T^{\mu\alpha}\beta_{\alpha} - \frac{1}{2}\omega_{\alpha\beta}S^{\mu,\alpha\beta} - \xi N^{\mu} + N^{\mu}_{eq}$$
(24)

.

< ロ > < 同 > < 回 > < 回 >

Conservations laws, now for total angular momentum J = L + S

$$\partial_{\mu} \mathbf{N}^{\mu} = \mathbf{0}, \qquad \partial_{\mu} \mathbf{T}^{\mu\nu} = \mathbf{0}, \qquad \partial_{\mu} \mathbf{S}^{\mu,\alpha\beta} = \mathbf{T}^{\beta\alpha} - \mathbf{T}^{\alpha\beta}$$
 (25)

entropy production

$$\partial_{\mu} S^{\mu} = -\delta N^{\mu} \partial_{\mu} \xi + \delta T_{s}^{\mu\lambda} \partial_{\mu} \beta_{\lambda} + \delta T_{a}^{\mu\lambda} \left( \partial_{\mu} \beta_{\lambda} - \omega_{\lambda\mu} \right) - \frac{1}{2} \delta S^{\mu,\alpha\beta} \partial_{\mu} \omega_{\alpha\beta} \ge 0 \quad (26)$$

#### Generalized Tolman-Klein conditions define global equilibrium state:

$$\partial_{\mu}\xi = 0, \qquad \partial_{(\mu}\beta_{\lambda)} = 0, \qquad \omega_{\lambda\mu} = \partial_{[\mu}\beta_{\lambda]} = -\frac{1}{2} \left( \partial_{\lambda}\beta_{\mu} - \partial_{\mu}\beta_{\lambda} \right)$$
(27)

the last condition says that the spin polarization tensor is equal to the thermal vorticity tensor (starting point for F. Becattini's approach) The middle equation,  $\partial_{\lambda}\beta_{\mu} + \partial_{\mu}\beta_{\lambda} = 0$ , is **the Killing equation** with a solution of the form

$$\beta^{\mu} = \beta_0^{\mu} + \varpi^{\mu\nu} \mathbf{x}_{\nu}, \qquad \varpi^{\mu\nu} = -\varpi^{\nu\mu} = \text{const}, \qquad \beta_0^{\mu} = \text{const}$$
(28)

One possible solution: rigid rotation with a very special boundary condition at  $R = 1/\Omega$ 

< ロ > < 同 > < 回 > < 回 >

### 3.2 Tensor decompositions

General (mathematical) decomposition of tensors into parts that are: i) either symmetric or antisymmetric, ii) either parallel or orthogonal to the flow, iii) with zero or non-zero trace. The simplest case, baryon current  $N^{\mu} = N^{\alpha} (\Delta^{\mu}{}_{\alpha} + u^{\mu}u_{\alpha})$ 

#### **Baryon current**

$$\mathbf{N}^{\mu} = au^{\mu} + b^{\mu} \tag{29}$$

here  $b^{\mu}u_{\mu} = 0$ , altogether 4 parameters

#### Energy-momentum tensor

$$T^{\mu\nu} = c u^{\mu} u^{\nu} - e \Delta^{\mu\nu} + d^{\mu}_{s} u^{\nu} + d^{\nu}_{s} u^{\mu} + e^{\langle \mu\nu \rangle}_{s} + d^{\mu}_{a} u^{\nu} - d^{\nu}_{a} u^{\mu} + e^{\mu\nu}_{a}$$
(30)

here:  $d_s^{\mu} u_{\mu} = d_a^{\mu} u_{\mu} = e_a^{\mu\nu} u_{\mu} = e_s^{\mu\nu} u_{\mu} = 0$ ,  $e_s^{(\mu\nu)}$  is symmetric and traceless,  $e_a^{\mu\nu}$  is antisymmetric 19 parameters, 3 can be eliminated by a suitable choice of the hydrodynamic flow (Landau vs. Eckart), 16 parameters left

#### Spin tensor

$$\mathbf{S}^{\lambda,\mu\nu} = -\mathbf{S}^{\lambda,\nu\mu} = u^{\lambda} \left[ (f^{\mu}u^{\nu} - f^{\nu}u^{\mu}) + \epsilon^{\mu\nu\rho\sigma}u_{\rho}\mathbf{w}_{\sigma} \right] + i^{\lambda\mu}u^{\nu} - i^{\lambda\nu}u^{\mu} + j^{\lambda\mu\nu}$$
(31)

here:  $f^{\mu}u_{\mu} = w^{\mu}u_{\mu} = 0$ ,  $i^{\lambda\mu}u_{\lambda} = i^{\lambda\mu}u_{\mu} = 0$ ,  $j^{\lambda\mu\nu} = -j^{\lambda\nu\mu}$ ,  $j^{\lambda\mu\nu}u_{\lambda} = j^{\lambda\mu\nu}u_{\mu} = j^{\lambda\mu\nu}u_{\nu} = 0$ ,  $i^{\lambda\mu}$  can be further decomposed into symmetric (with zero and non-zero trace) and antisymmetric parts 24 parameters

<ロ> <四> <四> <四> <四> <四</p>

#### Landau matching conditions

$$\mathbf{N}^{\mu}\boldsymbol{u}_{\mu} = \mathbf{N}^{\mu}_{\mathrm{eq}}\boldsymbol{u}_{\mu}, \qquad (32)$$

$$T^{\mu\nu}u_{\mu}u_{\nu} = T^{\mu\nu}_{eq}u_{\mu}u_{\nu}, \qquad (33)$$

$$\mathbf{S}^{\lambda,\mu\nu}\boldsymbol{u}_{\lambda} = \mathbf{S}^{\lambda,\mu\nu}_{\mathrm{eq}}\boldsymbol{u}_{\lambda}. \tag{34}$$

The consequences of Eqs. (32)-(34) are straightforward:

$$a = \bar{n}(T,\xi,k^2,\omega^2), \qquad (35)$$

$$c = \bar{\varepsilon}(T,\xi,k^2,\omega^2), \qquad (36)$$

$$f^{\mu} = A(T,\xi)k^{\mu}, \qquad (37)$$

$$\mathbf{w}^{\mu} = \mathbf{A}_{1}(T,\xi)\omega^{\mu}. \tag{38}$$

one can choose T,  $\xi$ ,  $k^{\mu}$ , and  $\omega^{\mu}$  (by solving Eqs. (35)–(38)) in such a way that certain parts of  $N^{\mu}$ ,  $T^{\mu\alpha}$ , and  $S^{\mu,\alpha\beta}$  have the form of the equilibrium tensor

### 3.3 Navier-Stokes limit

イロト イヨト イヨト イヨト

d

#### components of the total baryon current

$$b^{\mu} = -\lambda \nabla^{\mu} \xi + t^{\mu}. \tag{39}$$

#### energy-momentum tensor

$$s^{\mu} = -\kappa (Du^{\mu} - \beta \nabla^{\mu} T) + P_t t^{\mu}, \qquad (40)$$

$$d_{a}^{\mu} = -\lambda_{a}\beta^{-1}(\beta D u^{\mu} - \beta^{2}\nabla^{\mu}T - 2k^{\mu}), \qquad (41)$$

$$e = \bar{P} - \zeta \theta - (1/3) P_{k\omega} (k^2 + \omega^2), \qquad (42)$$

$$\mathbf{e}_{\mathbf{s}}^{\langle\mu\nu\rangle} = 2\eta\sigma^{\mu\nu} + P_{\mathbf{k}\omega}(\mathbf{k}^{\langle\mu}\mathbf{k}^{\nu\rangle} + \omega^{\langle\mu}\omega^{\nu\rangle}), \qquad (43)$$

$$\mathbf{e}_{\mathbf{a}}^{[\mu\nu]} = \gamma \left(\beta \nabla^{[\mu} u^{\nu]} + t^{\mu\nu}\right). \tag{44}$$

spin tensor

$$i^{\lambda\mu} = -\chi_1 \Delta^{\lambda\mu} u^{\beta} \nabla^{\alpha} \omega_{\alpha\beta} - \chi_2 u_{\nu} \nabla^{\langle \lambda} \omega^{\mu \rangle \nu}$$
(45)

$$-\chi_3 u_\nu \Delta^{[\mu}_{\rho} \nabla^{\lambda]} \omega^{\rho\nu} + \frac{\gamma_3}{2} t^{\lambda\mu},$$

$$j^{\lambda\mu\nu} = \frac{\chi_4}{2} \nabla^{\lambda} \omega^{\langle \mu \rangle \langle \nu \rangle} + \frac{A_3}{2} (\Delta^{\lambda\mu} k^{\nu} - \Delta^{\lambda\nu} k^{\mu}), \qquad (46)$$

# TWO SCALES FOR EXPANSION: GRADIENTS (KNUDSEN NUMBER) & MAGNITUDE OF THE SPIN POLARIZATION TENSOR

W. Florkowski (IFT UJ)

▶ < ≣ ► ≣ ৩৭০ July 1, 2024 26/30

### 4. Summary and Outlook

- a unified (hybrid) approach to spin hydrodynamics is proposed that combines the results of kinetic theory with the IS method
- consistency beetween LKT and IS approaches can be achieved
- technical difficulties of NLKT can be circumvented
- a different starting point compared to THV approach
- second order theory (in gradients) needed

### **Back-up slides**

イロト イヨト イヨト イヨト

#### $N^{\mu} = nu^{\mu}$ current = density × flow vector analogies for energy, momentum and spin

1) conservation of energy and momentum with an asymmetric energy-momentum tensor

$$T^{\mu\nu}(x) = g^{\mu}(x)u^{\nu}(x), \quad \partial_{\nu}T^{\mu\nu}(x) = 0$$
(47)

 $u^{\mu}$  is the four-velocity of the fluid element, while  $g^{\mu}$  is the density of four-momentum with the notation  $\partial_{\nu}(fu^{\nu}) \equiv Df$  we may write  $Dg^{\mu} = 0$ 

2) conservation of total angular momentum  $J^{\lambda,\mu\nu} = L^{\lambda,\mu\nu} + S^{\lambda,\mu\nu}$  (orbital and spin parts)

$$L^{\lambda,\mu\nu}(x) = x^{\mu}T^{\nu\lambda}(x) - x^{\nu}T^{\mu\lambda}(x), \quad S^{\lambda,\mu\nu}(x) = s^{\mu\nu}(x)u^{\lambda}(x)$$
(48)

 $s^{\mu\nu} = -s^{\nu\mu}$  describes the spin density

$$\partial_{\lambda} J^{\lambda,\mu\nu} = \mathbf{0} \to D s^{\mu\nu} = g^{\mu} u^{\nu} - g^{\nu} u^{\mu}$$
<sup>(49)</sup>

3) 10 equations for 13 unknown functions:  $g^{\mu}$ ,  $s^{\mu\nu}$  and  $u^{i}$  (i = 1, 2, 3) additional constraint has been adopted, the Frenkel (or Weyssenhoff) condition  $s^{\mu\nu}u_{\mu} = 0$ 

#### ideas still frequently cited in the context of the Einstein-Cartan theory

W. Florkowski (IFT UJ)

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

**Pseudo-gauge transformation** (QCD language in the context of the proton spin puzzle: adding boundary terms)

$$T^{\prime\mu\nu} = T^{\mu\nu} + \frac{1}{2} \partial_{\lambda} \left( \Phi^{\lambda,\mu\nu} + \Phi^{\nu,\mu\lambda} + \Phi^{\mu,\nu\lambda} \right)$$
(50)

$$S^{\prime\lambda,\mu\nu} = S^{\lambda,\mu\nu} - \Phi^{\lambda,\mu\nu} + \partial_{\rho} Z^{\mu\nu,\lambda\rho}$$
(51)

# One most often considers free Dirac field, should describe a gas of fermions, good starting point for thermodynamics and/or hydrodynamics

**Canonical forms** (directly obtained from Noether's Theorem): asymmetric energy-momentum tensor, spin tensor directly expressed by axial current (couples to weak interactions)

**Belinfante-Rosenberg version**,  $\Phi^{\lambda,\mu\nu} = S^{\lambda,\mu\nu}$ ,  $Z^{\mu\nu,\lambda\rho} = 0$ , (couples to classical gravity); spin tensor appears in modified theories of gravity, couples to torsion

de Groot, van Leuveen, van Weert (GLW) forms: symmetric energy-momentum tensor and conserved spin tensor

Hilgevoord and Wouthuysen (HW) choice: symmetric energy-momentum tensor and conserved spin tensor
